

Garrison Mobile Equipment (GME) Fleet Management System (FMS)

The Marine Corps has implemented an enterprise level commercial vehicle fleet management system to efficiently operate its Garrison Mobile Equipment (GME) fleet. FleetFocus™ FA is a comprehensive, Web-enabled, Windows-based Fleet Management System (FMS) that can track an unlimited number of GME assets and support an unlimited number of workstations in multiple locations. This system provides comprehensive recording and reporting of GME fleet management data in order to maximize the efficient use of Marine Corps commercial vehicle assets.

With the migration of multiple regional fleet management databases into one centralized database, the Marine Corps now has an unprecedented view of enterprise wide GME utilization and maintenance costs. This provides a robust analysis capability to support annual GME procurement/lease decisions and

for forecasting future GME requirements. This database and reporting capability supported regionalization of GME assets from MCB Camp Pendleton, MCAS Pendleton, MCAS Miramar, MCRD San Diego, MCAGCC and MWTC into a single vehicle pool under a single Fleet Manager. This consolidation eliminated redundant overhead and improved utilization of required transportation requirements. This initiative returned 242 Marines to the Operating Forces. Through the use of this FMS and the application of lessons learned and best business practices, underutilized vehicles have been removed from service keeping the overall size of the fleet in check. During FY 2006, the Marine Corps was able to reduce the overall size of the GME fleet even though support of the Global War On Terrorism and the increased recruiting and operational tempo added vehicles to the GME fleet.
